

Q- A police car is traveling at a velocity of 18.0 m/s due north, when a car zooms by at a constant velocity of 41.0 m/s due north. After a reaction time 0.900 s the policeman begins to pursue the speeder with an acceleration of 4.00 m/s<sup>2</sup>. Including the reaction time, how long does it take for the police car to catch up with the speeder?

The police car will catch up the speeder in a time when both will cover a same distance.

Let the total time taken is t (sec)

The velocity of the speeder's car = 41.0 m/s

Hence the distance covered by him in time t will be given by

$$S = \text{velocity} \times \text{time} = 41.0 \times t \quad \text{----- (1)}$$

The initial velocity of the police car u = 18.0 m/s

The distance covered by the police car during the reaction time

$$s_1 = 18.0 \times 0.900 = 16.2 \text{ m}$$

The acceleration of the police car a = 4.00 m/s<sup>2</sup>

The distance covered by the police car in the remaining time t - 0.900 is given by the second equation of motion [s = u\*t + 1/2 a\*t<sup>2</sup>]

$$\text{Or } s_2 = 18.0 \times (t - 0.900) + 0.5 \times 4.00 \times (t - 0.900)^2$$

Total distance covered by the police car in t sec will be

$$\begin{aligned} s_1 + s_2 &= 16.2 + 18.0 \times (t - 0.900) + 0.5 \times 4.00 \times (t - 0.900)^2 \\ &= 18.0 \times t + 2 \times (t - 0.900)^2 \quad \text{----- (2)} \end{aligned}$$

As after time t the police car catches the speeder hence the distance covered will be the same we have

$$s_1 + s_2 = S$$

Substituting from equations (1) and (2)

$$18.0 \times t + 2 \times (t - 0.900)^2 = 41.0 \times t$$

$$\text{Gives } t^2 - 1.8 t + 0.81 = (41 - 18) t / 2$$

$$\text{Gives } t^2 - 13.3 t + 0.81 = 0$$

$$\text{Or } t = \frac{-(-13.3) \pm \sqrt{(-13.3)^2 - 4 \times 1 \times 0.81}}{2 \times 1} = 13.239 \text{ s}$$

Hence the total time taken by the police car will be 13.239 s.
