

Q- A solenoid has length  $L = 30$  cm, radius 6 cm, and  $N_1 = 5500$  turns; its axis coincides with the z-axis. A circular conducting loop containing  $N_2 = 15$  turns of radius  $a = 3$  cm is **centered** inside the solenoid; the plane of the loop makes a  $30^\circ$  angle with respect to the z-axis. The loop has a net resistance of  $R = 0.015 \Omega$ . The current in the windings of the solenoid is varying with time according to the expression  $I_1(t) = 0.35 \text{ A} + 0.75 \text{ (A/s)} t$ . Calculate the magnitude of induced current in the loop at  $t = 4$  s.

The number of turns in the solenoid  $N_1 = 5500$

The length of the solenoid  $L = 30 \text{ cm} = 0.3 \text{ m}$

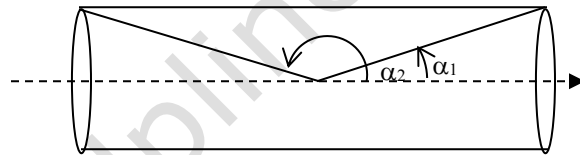

Hence the number of turns per unit length will be

$$n = N_1/L = 55000/3$$

The magnetic field  $B$  in a solenoid carrying current  $I_1$  at point where the edges of the solenoid subtends angles  $\alpha_1$  and  $\alpha_2$  is given by

$$B = \frac{1}{2} \mu_0 n I_1 (\cos \alpha_1 - \cos \alpha_2)$$

Or 
$$B = \frac{\mu_0 N_1 I_1}{2L} (\cos \alpha_1 - \cos \alpha_2)$$

As the loop is **centered** at the solenoid, the angle  $\alpha_2 = 180^\circ - \alpha_1$  and hence the field at the center of the solenoid is given by

$$B = \frac{\mu_0 N_1 I_1}{2L} (\cos \alpha_1 - \cos(180^\circ - \alpha_1)) = \frac{\mu_0 N_1 I_1}{2L} (\cos \alpha_1 + \cos \alpha_1) = \frac{\mu_0 N_1 I_1 \cos \alpha_1}{L}$$

And hence the flux through the loop is given by

$$\phi_B = N_2 (\vec{B} \cdot \vec{A}) = N_2 \left( \frac{\mu_0 N_1 I_1 \cos \alpha_1}{L} \right) A \cos \theta = \frac{\mu_0 N_1 N_2 A I_1 \cos \alpha_1 \cos \theta}{L}$$

Here  $\theta$  is the angle between the magnetic field vector and the area vector  $A$ . As the area vector is normal to the plane of the loop the angle between the field  $B$  and the area  $A$  vectors will be  $\theta = 90^\circ + 30^\circ = 120^\circ$

Hence the EMF induced in the loop is given by faraday's law as

$$\varepsilon = - \frac{d\phi_B}{dt} = - \frac{\mu_0 N_1 N_2 A \cos \alpha_1 \cos \theta}{L} * \frac{dI_1}{dt}$$

Now as  $I_1(t) = 0.35 \text{ A} + 0.75 \text{ (A/s)} t$

$$\frac{dI_1}{dt} = 0 + 0.75 = \frac{3}{4} \text{ A/s}$$

(Rate of change of current is independent of time)

Substituting in above equation we get

$$\varepsilon = -\frac{d\phi_B}{dt} = -\frac{3\mu_0 N_1 N_2 A \cos \alpha_1 \cos \theta}{4L}$$

And the magnitude of the current in the loop as a function of time will be given by

$$I_2 = \frac{\varepsilon}{R} = \frac{3\mu_0 N_1 N_2 A \cos \alpha_1 \cos \theta}{4LR}$$

Now here

$$\mu_0 = 4\pi * 10^{-7}$$

$$N_1 = 5500$$

$$N_2 = 15$$

$$A = \pi r^2 = 3.14 * 0.03^2 = 2.83 * 10^{-3} \text{ m}^2$$

$$\cos \alpha_1 = \frac{15}{\sqrt{15^2 + 6^2}} = 0.9285$$

$$\cos \theta = \cos 120^\circ = -0.5$$

$$t = 4 \text{ s}$$

$$L = 0.3 \text{ m}$$

And  $R = 0.015 \Omega$

Substituting all data, we get the current at  $t = 4 \text{ s}$  as

$$I_2 = \frac{3 * 4\pi * 10^{-7} * 5500 * 15 * 2.83 * 10^{-3} * 0.9285 * (-0.5)}{4 * 0.3 * 0.015}$$

Or  $I_2 = -0.0227 \text{ A}$

Hence current in the loop at any time is  **$I_2 = -0.0227 \text{ A}$**
