

Q- An object 5 cm high is located 73 cm from a converging lens of focal length  $f_1 = 45$  cm. A second converging lens of focal length  $f_2$  is located 178 cm from the first lens. An image of the object is to be formed on a screen 200 cm from the second lens. What must be the focal length  $f_2$  of the second lens so that the final image appears on the screen?

The lens formula gives the relation between the object distance  $u$  image distance  $v$  and the focal length  $f$  as

$$\frac{1}{v} - \frac{1}{u} = \frac{1}{f}$$

For the first lens using the signs according to sign conventions

$$u = -73 \text{ cm}$$

$$v = ?$$

$$f = 45 \text{ cm}$$

We have 
$$\frac{1}{v} - \frac{1}{-73} = \frac{1}{45}$$

Or 
$$\frac{1}{v} = -\frac{1}{73} + \frac{1}{45} = \frac{-45+73}{73*45} = \frac{28}{3285}$$

Gives 
$$v = 3285/28 = 117.3 \text{ cm}$$

This image will behave as an object for the second lens at a distance  $x_2 - v$  form it on the right side and forms an image on the screen which is  $x_3 = 200$  cm from the lens hence if the focal length of the second lens be  $f_2$  then for the second lens with proper sings we have

$$u = - (178 - 117.3) = - 60.7 \text{ cm}$$

$$v = + 200 \text{ cm}$$

$$f_2 = ?$$

Using lens formula for the second lens we get.

$$\frac{1}{200} - \frac{1}{-60.7} = \frac{1}{f_2}$$

Or 
$$\frac{1}{f_2} = \frac{60.7+200}{200*60.7} = \frac{260.7}{12140}$$

Or 
$$f_2 = 12140/260.7 = 46.57 \text{ cm.}$$

Thus the focal length of the second lens must be 46.57 cm.
